Draw a simple diagram showing the main components of a food delivery app like Zomato or Swiggy (such as user, restaurant, order, delivery partner, payment) and label how they interact in the software architecture.

2.Pick any app you use daily (Instagram, Paytm, Flipkart, etc.) and list 5 different testing activities that must be performed before the app is released to users.

Hint: Think about things like login, payment, notifications, speed, and security.

App Selected: Paytm

Before releasing the Paytm app to users, the following five testing activities should be performed.

1. Login Testing: Check whether users can log in using their registered mobile number and the correct OTP. Also check whether an incorrect OTP is handled properly.
2. Payment Testing: Check whether payments are completed successfully and whether failed or duplicate transactions are handled correctly.

3. Notification Testing: Check whether users receive the correct notifications after successful payments and failed transactions.

4. Performance Testing: Check whether the app opens quickly and works smoothly, even when many users are using it at the same time.

5. Security Testing: Check whether users' personal information and payment details are protected from unauthorised access.

3.Explain in your own words why testing is important at each stage of the Software Development Life Cycle (SDLC), using an example from an app like BookMyShow or IRCTC.

Testing is important at every stage of the Software Development Life Cycle (SDLC) because it helps identify problems early and ensures that the software meets users' requirements. Example: BookMyShow App

1. Requirement Analysis: Testers check whether the requirements are clear and complete. For example, they check whether the requirements explain how users can search for movies and book tickets.

2. Design Stage: Testers review the design to identify possible problems. For example, they check whether the seat-selection screen is easy to understand.

3. Development Stage: Testers check the features being developed. For example, they verify whether movie search and seat selection work correctly.

4. Testing Stage: Testers check whether all the features work correctly together. For example, they test ticket booking, payment and booking confirmation.

5. Deployment Stage: Testers perform final checks to ensure that the application works correctly before it is released to users.

6. Maintenance Stage: Testers check bug fixes and new updates to ensure that existing features continue to work correctly.

4.Write down the main objectives and purpose of testing by imagining you are part of a team launching a new music streaming feature in Spotify. List at least 3 objectives and explain each in one line.

The main objectives of testing this feature are:

1. Functionality Testing: Check whether users can download songs successfully and play them without an internet connection.

2. Performance Testing: Check whether songs download and play smoothly without unnecessary delays or application crashes.

3. Compatibility Testing: Check whether the feature works correctly on supported mobile devices and operating system versions.

4. Security Testing: Check whether downloaded music can be accessed according to the user's account permissions and applicable subscription rules.
